ITEC 204 – Data Structures and Algorithms

Name: Payra, Ralph Marco T.	Date: 09/24/2026
Section: BSIT-2A	Instructor: Ms. Maxyne Nuela

- I. **Objective:** Write a short explanation of what your program is designed to do. (Minimum of 3 sentences)

Answer:

This program manages incident tickets reported by automation bots. It allows the user to add new tickets, see all tickets, search for a specific ticket, remove solved tickets, and count the tickets that are still active. It uses a list to store and organize all the tickets.

- II. **Program Operations:** Briefly explain how your program performs each operation. (Insert Specific Code Line and Your Explanation)

Add Incident:

`tickets.append(ticket)`

This line adds the new ticket to the end of the list.

Display Incidents:

`for ticket in tickets:`

This loop goes through the list one by one and prints each ticket.

Search Incident:

`if ticket["id"] == incident_id:`

This checks each ticket in the list to find the one that matches the ID the user typed.

Remove Resolved Incident:

`tickets.remove(ticket)`

This takes the matching ticket out of the list once it is found.

College of Computer Studies

Count Active Incidents:

len(tickets)

This counts how many tickets are still left in the list.

- III. **Flowchart:** Create a flowchart showing the overall process and logic of your program.

- IV. **Conclusion:** Briefly explain what you learned from the activity and how the linear data structure was applied.

- From this activity, I learned how to use a list to store and manage records. I learned that I can add, remove, search, and count items in a list. This helped me understand how lists keep data organized and easy to manage.
